

Cost Planning

Before committing funds and time to a proposed development, a construction project client will want to be assured that any risks impacting upon the construction process are identified and addressed from the outset.

Our approach has been developed through analysis and understanding of project financier's key requirements, which are based on:

- **Practical Advice:** - On the projects feasibility in relation to the design conception, functionality, funding, and site location.
- **Informed Opinion:** - On how the overall development idea can be achieved with a view to meeting the client's expectation and value for money.
- **Risk Assessment:** - Attempt to document an awareness of the known and unknown risks such as; political, economic, social, technological, environmental, legal, and safety issues that could potentially impact upon the project actualization.
- **Forward Forecasting:** - With our experience in the assessment of cost, schedule, procurement, and risk, we construct a full blueprint of the project practicality and assess the magnitude of resources that it requires. Our project control team will advise on the key elements that may influence the success of the project.
